

BETWEEN-SESSION PRACTICE

We sent **zero notifications**. They practiced anyway.

What a pilot of 24 adults changed about what we build.

TUESDAY

THE PROBLEM

You set the practice on **Tuesday.**

You find out the following Tuesday whether it happened. In between, the week is invisible to both of you, and the first fifteen minutes of the next session go on rebuilding it from memory.

WHAT WE MEASURED

So we **turned the reminders off.**

24

adults in the pilot

21

practiced between sessions

340

practice recordings
submitted

0

notifications sent by us

● Engagement, not clinical outcome

WHAT CARRIED IT

Three things, **none of them a reminder.**

01 **Short**

Five minutes, not an evening.

02 **Yours, not ours**

Tied to the technique you set in the session.

03 **Seen**

Visible to you afterwards, not filed away.

WHAT YOU OPEN

The week, **before the session starts.**

Not a checkbox saying the practice was done. The recordings themselves, the days they happened on, and the technique they were working on.

Days practiced

Technique set

WHAT THIS DOES NOT SHOW

The **honest** version.

One pilot. 24 people. Self-selected.

No control arm, and nothing published.

It measures whether people practiced, not how they spoke.

It says nothing about any clinical outcome, and we will not imply that it does.

OVER TO YOU

What actually gets **home practice done** in your caseload?

We spend our effort on making the week visible rather than on getting better at nagging. If something else works better in your practice, we would like to know what.
